Reason was originally released in 1995 as a hardware rack mountable unit similar to an effects processor or MIDI controller for creating beats, sounds, songs etc. The original rack was intended to run on batteries or AC power with no computer required to control any of its functions. Its first software release came in 1996 when Reason was included with the Roland MC-8 Microcomposer. The news version of Reason, 1.1, was released in 1997 and included many updates to the original MC-8 software such as support for VST instruments and drumsounds. Reason 2 (1999) was a major update to the full Reason product including a new audio engine and improved sampling capabilities. Version 2 introduced support for .wav files and offered an audio scripting language called Subtractor. Subtractor allowed users to write programs that modify audio waveforms and pitch or manipulate other audio objects in ways that were previously not possible (for example, creating complex melodies without having to write musical code).
